Institute of Zoology Faculty of Life sciences University of the Punjab, Lahore Course Outline

phylogenetics and biogeography 2. Identify and classify organisms using morphological, anatomical, molecular, behavioral and othe characteristics. 3. Analyze and interpret phylogentic trees and cladogram. 4. Develop critical thinking skill to understand evolutionary relationships and biodiversity. 5. Communicate systematic concept and research .findings effectively through written and or presentation. Keek 1 Introduction to systematic to Biology Concepts of taxon, phenon and category Concepts of category Concepts of category Week 3 Species concepts: Typological and Nominalistics Species concepts: Evolutionary Paper on different concep of species Week 4 Species concepts: Mate recognition, Cohesion	Program	ne BS Zoology	Course Code	ZOOL-404	Credit Hours	2				
Systematics is the exciting and ever-changing discipline which treats the kinds and the diversity or organisms and of any and all relationships which exist among them. This course will provide comprehensive survey of the theory and methodology of systematics as they are applied toda to all groups of organisms. The course is directed at those students interested in studies of evolutional biology, todiversity, conservation biology, and/or systematics. Some of the topics that will be considerer include: species concepts and mechanisms of speciation, the major contemporary schools of taxonomy methodologies of phylogeny estimation, the systematic significance of patterns of geographic distribution, considerations of molecular evolution as applied to systematic studies, the formation and us of research collections and nomenclature. Learning Outcomes On the completion of the course, the students will: 1. Understand the fundamental principles and methods of systematic biology including taxonomy phylogenetics and biogeography 2. Identify and classify organisms using morphological, anatomical, molecular, behavioral and othe characteristics. 3. Analyze and interpret phylogentic trees and cladogram. 4. Develop critical thinking skill to understand evolutionary relationships and biodiversity. 5. Communicate systematics Segments/Readings Week 1 Introduction to sytematics Course Content Assignments/Readings Week 1 Introduction to sytematics Course Content </th <th>Course Ti</th> <th>tle Principles of Systematics</th> <th></th> <th></th> <th></th>	Course Ti	tle Principles of Systematics								
organisms and of any and all relationships which exist among them. This course will provide comprehensive survey of the theory and methodology of systematics as they are applied toda to all groups of organisms. The course is directed at those students interested in studies of evolutionan biology, biodiversity, conservation biology, and/or systematics. Some of the topics that will be considered include: species concepts and mechanisms of speciation, the major contemporary schools of taxonom methodologies of phylogeny estimation, the systematic significance of patterns of geographic distribution, considerations of molecular evolution as applied to systematic studies, the formation and us of research collections and nomenclature. Learning Outcomes On the completion of the course, the students will: 1 Understand the fundamental principles and methods of systematic biology including taxonom phylogenetics and biogeography 2. Identify and classify organisms using morphological, anatomical, molecular, behavioral and othe characteristics. 3. Analyze and interpret phylogentic trees and cladogram. 4. Develop critical thinking skill to understand evolutionary relationships and biodiversity. 5. Communicate systematics Massignments/Readings Week 1 Introduction to sytematics Assignments/Readings Week 2 Concepts of taxon, phenon and category Concepts of category Week 3 Species concepts: Typological and Nominalistics Paper on di	Course Introduction									
On the completion of the course, the students will: 1. Understand the fundamental principles and methods of systematic biology including taxonomy phylogenetics and biogeography 2. Identify and classify organisms using morphological, anatomical, molecular, behavioral and othe characteristics. 3. Analyze and interpret phylogentic trees and cladogram. 4. Develop critical thinking skill to understand evolutionary relationships and biodiversity. 5. Communicate systematic concept and research .findings effectively through written and orapresentation. Course Content Assignments/Readings Week 1 Introduction to sytematics Concepts of taxon, phenon and category Concepts of category Week 3 Species concepts: Typological and Nominalistics Species concepts: Evolutionary Paper on different concept of species Week 4 Species concepts: Evolutionary Paper on different concept of species	organisms a comprehens to all groups biology, bio include: spe methodolog distribution,	is the exciting and ever-changing discipline which treats the kinds and the diversity of and of any and all relationships which exist among them. This course will provide a sive survey of the theory and methodology of systematics as they are applied today s of organisms. The course is directed at those students interested in studies of evolutionary diversity, conservation biology, and/or systematics. Some of the topics that will be considered ecies concepts and mechanisms of speciation, the major contemporary schools of taxonomy, ties of phylogeny estimation, the systematic significance of patterns of geographical , considerations of molecular evolution as applied to systematic studies, the formation and use								
1. Understand the fundamental principles and methods of systematic biology including taxonomy phylogenetics and biogeography 2. Identify and classify organisms using morphological, anatomical, molecular, behavioral and othe characteristics. 3. Analyze and interpret phylogentic trees and cladogram. 4. Develop critical thinking skill to understand evolutionary relationships and biodiversity. 5. Communicate systematic concept and research .findings effectively through written and or presentation. Veek 1 More Course Content Assignments/Readings Week 1 Course Content Method Signments/Readings Week 1 More to sytematics Veek 3 Species concepts: Typological and Nominalistics Species concepts: Evolutionary Paper on different concep of species Species concepts: Evolutionary Paper on different concep of species		Learn	ing Outcomes							
Week 1 Introduction to systematics Contribution of systematic to Biology Concepts of taxon, phenon and category Week 2 Concepts of taxon, phenon and category Concepts of category Species concepts: Typological and Nominalistics Week 3 Species concepts : Biological, Week 4 Species concepts: Evolutionary Species concepts: Mate recognition, Cohesion Paper on different conceptor	 Understand the fundamental principles and methods of systematic biology including taxonomy, phylogenetics and biogeography Identify and classify organisms using morphological, anatomical, molecular, behavioral and other characteristics. Analyze and interpret phylogentic trees and cladogram. Develop critical thinking skill to understand evolutionary relationships and biodiversity. Communicate systematic concept and research .findings effectively through written and oral 									
Week 1 Contribution of systematic to Biology Week 2 Concepts of taxon, phenon and category Concepts of category Concepts of category Week 3 Species concepts: Typological and Nominalistics Week 4 Species concepts: Biological, Week 4 Species concepts: Evolutionary Paper on different conceptor of species Species concepts: Mate recognition, Cohesion Paper on different conceptor		Course Content		Ass	ignments/Readin	igs				
Week 2 Concepts of category Week 3 Species concepts: Typological and Nominalistics Species concepts : Biological, Species concepts: Biological, Week 4 Species concepts: Evolutionary Paper on different conceptor of species Species concepts: Mate recognition, Cohesion Paper on different conceptor	Week 1									
Week 3 Species concepts: Typological and Nominalistics Week 4 Species concepts: Biological, Week 4 Species concepts: Evolutionary Species concepts: Mate recognition, Cohesion	Week 2									
Week 4 Species concepts: Evolutionary of species Species concepts: Mate recognition, Cohesion	Week 3	Species concepts: Typological and								
	Week 4	Species concepts: Evolutionary of species								
Week 5 Subspecies concept and their problems Clines and hybrid zones, Polytypic species, Superspecies										
Week 6 Modes of speciation Intrapopulation variation Intrapopulation	Week 5	Subspecies concept and their probl	ems	ecies						
Week 7 Intrapopulation variation (Continued) Intrapopulation variation (Continued) Intrapopulation variation (Continued) Week 8 Different kinds of taxonomic characters Different kinds of taxonomic characters (continued)		Subspecies concept and their probl Clines and hybrid zones, Polytypic Modes of speciation	ems	ecies						

XX 1 0	Weightage of ta	xonomic charact	ers					
Week 9	Weightage of ta	xonomic charact	rs (continued)					
Week 10	Classification and its types		Variations in characters used for classifications					
Week 10	Phenetics classi	fication						
	Phenetics classi	fication (continue	ed)					
Week 11	Cladistics classification							
W 1 10	evolutionary cla	ssification						
Week 12	Difference betw	Difference between types of classification						
	Taxonomic coll	ections and the p	rocess of identification					
Week 13	Taxonomic col (continued)	Taxonomic collections and the process of identification						
Week 14	Types of taxono	mic publications	3					
WEEK 14		f taxonomic artic	cles					
			ature (interpretation)					
Week 15	application of principle)	the codes (stab	bility, priority, first reviser					
	1.1. 6	Range of authority of code; concept of availability and						
Week 16		nonym, homony	m
